

Data Source

There is one main data set (*Field_baseline_all.dta*) used for the analysis, which is located in “Field/ Field_Data”.

Field_baseline_all.dta Data set containing all relevant data on demographics as well as experienced complications and beliefs about maternal mortality for all individuals interviewed during the baseline survey. All variables in the data set have self-explaining labels. Where relevant, notes were added to the variables for clarification.

Programming File

There is one main program file (*Field_analysis.do*) used for the analysis, which is located in “Field/Field_Dofiles”. It produces all tables and figures contained in the paper and exports them using .tex and .pdf formats to “Field/Field_Tables”.

Field_analysis.do Dofile which produces all tables displayed in the article and in the online appendix. The user has to define the path for the global **\$zamb** to their relevant working directory in the first line of active code to determine the core path. All other paths will refer to this global and are self-contained as long as the structure of the folder “Field” is not changed.
